## **ACKNOWLEDGEMENT**

I would like to express my sincere gratitude to Mr. Shahrul Fithry Bin Senin, my beloved advisor for his guidance and providing me with invaluable information until I got to finish up this research.

I would like to take this opportunity to deliver my thanks to all my friends in giving their encouragement and moral supports to make the completion of this research.

Lastly, thanks to my parents for their support and also to my research partner to make this study a success.

Thank you.

## **ABSTRACT**

The failure of bolted connections will present serious economic and human consequences, so it is important to obtain a better understanding of the structural behavior of bolted connections. The objective of this study is to find the best numerical bolt model and analyzing their behavior when subjected to tensile loads. There are three models of bolt will be analyze for this study. First model was analysed using brick element, second model using beam element and the third model bolt using joint element. For this study the finite element software, LUSAS will be used to study the various connection models. Convergence study was conducted in this research. For this study, it was found that the brick element is the best model as compared with the beam element and joint element.
